Question 1

Correct

Marked out of 25.00

Sam loves chocolates and starts buying them on the 1st day of the year. Each day of the year, x, is numbered from 1 to Y. On days when x is odd, Sam will buy x chocolates; on days when x is even, Sam will not purchase any chocolates.

Complete the code in the editor so that for each day Ni (where $1 \le x \le N \le Y$) in array arr, the number of chocolates Sam purchased (during days 1 through N) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.

Input Format

The program takes an array of integers as a parameter.

The locked code in the editor handles reading the following input from stdin, assembling it into an array of integers (arr), and calling calculate(arr).

The first line of input contains an integer, T (the number of test cases). Each line i of the T subsequent lines describes the ith test case as an integer, Ni (the number of days).

Constraints

```
1 \le T \le 2 \times 10^5
```

 $1 \le N \le 2 \times 10^6$

 $1 \le x \le N \le Y$

Output Format

For each test case, Ti in arr, your calculate method should print the total number of chocolates Sam purchased by day Ni on a new line.

Sample Input 0

1

2

Sample Output 0

1

1

4

Explanation

Test Case 0: N = 1

Sam buys 1 chocolate on day 1, giving us a total of 1 chocolate. Thus, we print 1 on a new line.

Test Case 1: N = 2

Sam buys 1 chocolate on day 1 and 0 on day 2. This gives us a total of 1 chocolate. Thus, we print 1 on a new line.

Test Case 2: N = 3

Sam buys 1 chocolate on day 1, 0 on day 2, and 3 on day 3. This gives us a total of 4 chocolates. Thus, we print 4 on a new line.

For example:

Input	Result
3	1
1	1
2	4
3	

```
Input Result

Question **2**Incorrect

Marked out of 25 00

Watson gives Sherlock an array of integers. His challenge is to find an element of the array such that the sum of all elements to the left is equal to the sum of all elements to the right. For instance, given the array **arr** = [5, 6, 8, 11], 8 is between two subarrays that sum to 11. If your starting array is [1], that element satisfies the rule as left and right sum to 0.

You will be given arrays of integers and must determine whether there is an element that meets the criterion.

Complete the code in the editor below. It should return a string, either YES if there is an element meeting the criterion or NO otherwise.

It has the following:

· arr: an array of integers

Input Format

The first line contains T, the number of test cases.

The next **T** pairs of lines each represent a test case.

- The first line contains **n**, the number of elements in the array **arr**.
- The second line contains n space-separated integers arr[i] where $0 \le i < n$.

Constraints

- · 1 ≤ T ≤ 10
- $\cdot 1 \le n \le 10^5$
- $1 \le arr[i] \le 2 \times 10^4$
- $0 \le i \le n$

Output Format

For each test case print YES if there exists an element in the array, such that the sum of the elements on its left is equal to the sum of the elements on its right; otherwise print NO.

Sample Input 0

2

3

123

4

1233

Sample Output 0

NO

YES

Explanation 0

For the first test case, no such index exists.

For the second test case, arr[0] + arr[1] = arr[3], therefore index 2 satisfies the given conditions.

Sample Input 1

3

5

11411

4

2000

4

0020

Sample Output 1

YES

YES

YES

Explanation 1

In the first test case, arr[2] = 4 is between two subarrays summing to 2.

In the second case, arr[0] = 2 is between two subarrays summing to 0.

In the third case, arr[2] = 2 is between two subarrays summing to 0.

For example:

Ir	ıp	ut	Result		
3					YES
5					YES
1	1	4	1	1	YES
4					
2	0	0	0		
4					
0	0	2	0		
2					NO
3					YES
1	2	3			
4					
1	2	3	3		

Answer: (penalty regime: 0 %)

```
1 | import java.util.*;
2 → public class Sum{
        public static void main(String[] args)
3
4 ₹
5
             Scanner sc=new Scanner(System.in);
6
             int t=sc.nextInt();
             int val=0;
7
8
             for(int i=0;i<t;i++)</pre>
9 *
10
                  int n=sc.nextInt();
                  int a[]=new int[n];
11
12
                  for(int j=0;j<n;j++)</pre>
13 🔻
14
                      a[i]=sc.nextInt();
                      //System.out.print(a[i]+" ");
15
16
17
                  for(int k=0;k<n;k++)</pre>
18 ,
                      if(k==0 \text{ or } k==n-1)
19
20 🔻
                      {
                           val+=<mark>0</mark>;
21
22
23 🔻
                      else{
                           val+=a[]
24
25
26
27
                  //System.out.println();
28
29
        }
30
```

Question **3**Correct

Marked out of 25.00

Sunny and Johnny like to pool their money and go to the ice cream parlor. Johnny never buys the same flavor that Sunny does. The only other rule they have is that they spend all of their money.

Given a list of prices for the flavors of ice cream, select the two that will cost all of the money they have.

For example, they have m = 6 to spend and there are flavors costing cost = [1, 2, 3, 4, 5, 6]. The two flavors costing 1 and 1 meet the criteria. Using 1-based indexing, they are at indices 1 and 1.

Function Description

Complete the code in the editor below. It should return an array containing the indices of the prices of the two flavors they buy.

It has the following:

- \cdot m: an integer denoting the amount of money they have to spend
- \cdot cost: an integer array denoting the cost of each flavor of ice cream

Input Format

The first line contains an integer, *t*, denoting the number of trips to the ice cream parlor. The next *t* sets of lines each describe a visit. Each trip is described as follows:

- 1. The integer **m**, the amount of money they have pooled.
- 2. The integer n, the number of flavors offered at the time.
- 3. *n* space-separated integers denoting the cost of each flavor: *cost[cost[1], cost[2], ..., cost[n]*].

Note: The index within the cost array represents the flavor of the ice cream purchased.

Constraints

- \cdot 1 \leq t \leq 50
- $\cdot 2 \le m \le 10^4$
- $\cdot 2 \le n \le 10^4$
- $1 \le \cos[i] \le 10^4$, " i Î [1, n]
- · There will always be a unique solution.

Output Format

For each test case, print two space-separated integers denoting the indices of the two flavors purchased, in ascending order.

Sample Input

2

4 5

_

14532

4

2243

Sample Output

14

12

Explanation

Sunny and Johnny make the following two trips to the parlor:

- 1. The first time, they pool together m = 4 dollars. Of the five flavors available that day, flavors 1 and 4 have a total cost of 1 + 3 = 4.
- 2. The second time, they pool together m = 4 dollars. TOf the four flavors available that day, flavors 1 and 2 have a total cost of 2 + 2 = 4.

For example:

Answer: (penalty regime: 0 %)

```
1 import java.util.*;
 2 public class Money
3 ₹ {
        public static void main(String[] args)
4

Passed all tests! 🗸

Marked out of 25.00

Numeros the Artist had two lists that were permutations of one another. He was very proud. Unfortunately, while transporting them from one exhibition to another, some numbers were lost out of the first list. Can you find the missing numbers?

As an example, the array with some numbers missing, arr = [7, 2, 5, 3, 5, 3]. The original array of numbers brr = [7, 2, 5, 4, 6, 3, 5, 3]. The numbers missing are [4, 6].

Notes

- · If a number occurs multiple times in the lists, you must ensure that the frequency of that number in both lists is the same. If that is not the case, then it is also a missing number.
- \cdot You have to print all the missing numbers in ascending order.
- · Print each missing number once, even if it is missing multiple times.
- · The difference between maximum and minimum number in the second list is less than or equal to 100.

Complete the code in the editor below. It should return an array of missing numbers.

It has the following:

- \cdot arr: the array with missing numbers
- \cdot brr: the original array of numbers

Input Format

There will be four lines of input:

n - the size of the first list, arr

The next line contains *n* space-separated integers *arr[i]*

m - the size of the second list, brr

The next line contains *m* space-separated integers *brr[i]*

Constraints

- $\cdot~1 \leq n,\,m \leq 2~x~10^5$
- · n ≤ m
- $\cdot \ 1 \leq brr[i] \leq 2 \ x \ 10^4$
- $\cdot X_{max} X_{min} < 101$

Output Format

Output the missing numbers in ascending order.

Sample Input

10

203 204 205 206 207 208 203 204 205 206

13

203 204 204 205 206 207 205 208 203 206 205 206 204

Sample Output

204 205 206

Explanation

204 is present in both arrays. Its frequency in *arr* is 2, while its frequency in *brr* is 3. Similarly, 205 and 206 occur twice in *arr*, but three times in *brr*. The rest of the numbers have the same frequencies in both lists.

For example:

Input								Res	ult						
10													204	205	206
203 2	204	205	206	207	208	203	204	205	206						
13															
203 2	204	204	205	206	207	205	208	203	206	205	206	204
